

Lab 1: Hello R!

The goal of this lab is to acquaint you with R (the computing language), RStudio (the IDE, integrated development environment), and Posit Cloud (the browser based service we will use to access RStudio).

Getting started

1. Go to [Duke Container Manager](#) and create a new folder titled **lab-1 - Hello R!**.
2. Under the *Files* tab on the lower right, click on the upload button to upload `lab-1.qmd`.

3. Complete the exercises in this document.

Toolkit review

YAML

The top portion of your Quarto Markdown file (aka `.qmd`), you'll find three dashed lines. Between the dashed lines is called YAML. YAML stands for "Yet Another Markup Language". It is a human friendly data serialization standard for all programming languages. All you need to know is that this area is called the YAML (we will refer to it as such) and that it contains meta information about your document.

Change the **author** name to your name and update the **date** with today's date. Click the **Render** to render the document. What do you notice?

i Note

To avoid issues that can occur while rendering, it is a good idea to render early and often. **At least after every exercise.**

Packages

In this lab we will work with three packages: the **tidyverse** package which is a collection of packages for doing data analysis in a “tidy” way, the **datasauRus** package which contains the data set for the first part of your lab.

```
library(tidyverse)
library(datasauRus)
```

⚠ Warning

If you are using R on Duke Containers, packages we use should already be installed and only need to be **loaded** with the function `library()`. If you are using a local version of R you probably have to run the following code in the **console** to install the packages (one time only!)

```
install.packages("tidyverse")
install.packages("datasauRus")
```

Code style

For all assignments in this course there is a “code style and formatting” component to the grade. To receive full points for this component, you must:

1. There is a line break after each `|>` in a pipeline or `+` in a `ggplot`.
2. There are spaces around `=` signs.
3. There is a space after each `,`.
4. Code is properly indented.

5. Code doesn't exceed 80 characters in each line, longer lines of code are spread across multiple lines with appropriately placed line breaks. (In the rendered document, you shouldn't have to scroll to see all your code.)
6. Code chunks are labeled, informatively and without spaces.

These guidelines follow the [tidyverse style guide](#). This style guide is commonly used and will help make your code more legible.

Part 1: `datasauRus`

The data frame we will be working with for the first part of the lab is called `datasaurus_dozen` and it's in the `datasauRus` package. Actually, this single data frame contains 13 data sets (a “baker's dozen”), designed to show us why data visualization is important and how summary statistics alone can be misleading. The different data sets are marked by the data set variable.

To find out more about the data set, type the following in your console (this will bring up the help file).

```
?datasaurus_dozen
```

Exercise 1

Based on the help file, how many rows and how many columns does the `datasaurus_dozen` file have? What are the **variables** included in the data frame? Add your responses to your lab report under “Exercise 1”.

Let's take a look at the names of the data sets inside of `datasaurus_dozen`. To do so this, we can make a frequency table of the “data set” variable. Run the code chunk below. Note: when you run the code chunk below, a table “prints” to the screen. In general, we say “print to screen” to mean that the output of your code should show up on your screen (when asked to ‘print to screen’ in an assignment, you should make sure the output displays in your rendered document).

```
datasaurus_dozen |>  
  count(dataset)
```

```
# A tibble: 13 x 2  
  dataset      n  
  <chr>      <int>  
1 away      142
```

2	bullseye	142
3	circle	142
4	dino	142
5	dots	142
6	h_lines	142
7	high_lines	142
8	slant_down	142
9	slant_up	142
10	star	142
11	v_lines	142
12	wide_lines	142
13	x_shape	142

The original Datasaurus (dino) data was created by Alberto Cairo. The other Dozen were generated using simulated annealing and the process is described in the paper *Same Stats, Different Graphs: Generating data sets with Varied Appearance and Identical Statistics through Simulated Annealing* by Justin Matejka and George Fitzmaurice. In the paper, the authors simulate a variety of data sets that have the same summary statistics as the original Datasaurus but have very different data.

i Note

You can view the whole data frame by running the code `view(datasaurus_dozen)` in the console. This will open the data frame in a new tab. Try it out!

Exercise 2

Plot y vs. x for the dino data set. Then, calculate the correlation coefficient between x and y for this data set. Make sure that this value is printed in your document.

Below is the code you will need to complete this exercise. Basically, the answer is already given, but you need to include relevant bits in your `.qmd` document and successfully render it and view the results.

Start with the `datasaurus_dozen` and pipe it into the filter function to filter for observations where `dataset == "dino"`. Store the resulting filtered data frame as a new data frame called `dino_data`.

```
dino_data <- datasaurus_dozen |>
  filter(dataset == "dino")
```

There is a lot going on here, so let's slow down and unpack it a bit.

First, the pipe operator: `|>`, takes what comes before it and sends it as the first argument to what comes after it. So here, we're saying filter the `datasaurus_dozen` data frame for observations where `dataset == "dino"`.

Second, the assignment operator: `<-`, assigns the name `dino_data` to the filtered data frame.

i Note

Note in R you may use either `<-` or `=` for an assignment operator. We'll use `<-` in this class as it's the more commonly used assignment operator, but when you look for R help online, you might see `=` being used as well.

Next, we need to visualize these data. We will use the `ggplot` function for this. Its first argument is the data you're visualizing. Next we define the `aesthetic` mappings. In other words, the columns of the data that get mapped to certain aesthetic features of the plot, e.g. the x axis will represent the variable called `x` and the y axis will represent the variable called `y`. Then, we add another layer to this plot where we define which geometric shapes we want to use to represent each observation in the data. In this case we want these to be points, hence `geom_point`.

```
ggplot(dino_data, aes(x = x, y = y)) +  
  geom_point()
```

For the second part of this exercise, we need to calculate a summary statistic: the correlation coefficient. The correlation coefficient (r) measures the strength and direction of the linear association between two variables. You will see that some of the pairs of variables we plot do not have a linear relationship between them. This is exactly why we want to visualize first: visualize to assess the form of the relationship, and calculate r only if relevant.

In this case, calculating a correlation coefficient really doesn't make sense since the relationship between x and y is definitely not linear, but is instead more 'dinosaur-esque'.

For illustrative purposes only, let's calculate the correlation coefficient between x and y .

```
dino_data |>
  summarize(r = cor(x, y))
```

```
# A tibble: 1 x 1
      r
  <dbl>
1 -0.0645
```

Exercise 3

Plot y vs. x for the star dataset. You can (and should) reuse code we introduced above, just replace the dataset name with the desired dataset. Then, calculate the correlation coefficient between x and y for this dataset. How does this value compare to the r of dino?

To begin, edit the name of the code chunks from `ex-3-1` and `ex-3-2` to something more meaningful, e.g: `plot-star` and `r-star` respectively.

Exercise 4

Finally, let's plot all datasets at once. In order to do this we will make use of faceting, given by the code below:

```
ggplot(datasaurus_dozen, aes(x = x, y = y, color = dataset)) +
  geom_point() +
  facet_wrap(~ dataset, ncol = 3)
```

And we can use the `group_by` function to generate all the summary correlation coefficients. We'll see these functions again and again.

```
datasaurus_dozen |>
  group_by(dataset) |>
  summarize(r = cor(x, y))
```

Exercise 5

Describe what `|>` does. Hint: run the following two code chunks. What do you notice?

```
dino_data |>
  summarize(
    mu_x = mean(x),
    mu_y = mean(y)
  )
```

```
summarize(dino_data, mu_x = mean(x), mu_y = mean(y))
```

Exercise 6

In the above code chunk, identify each of the following as an argument or a function:

- `summarize`
- `dino_data`
- `mean`
- `x`
- `y`
- `mu_x = mean(x)`

Exercise 7

Combine the code from exercises 4 and 5 to compute the `mean(x)` and `mean(y)` for each data set. Print your result to the screen. What do you notice? What does this say about the importance of visualizing your data as opposed to only looking at summary statistics?

Part 2: IMS Exercises

The exercises in this section do not require code. Make sure to answer the questions in full sentences.

Exercise 8

IMS - [Chapter 1 exercises](#), #4: Cheaters, study components.

Exercise 9

IMS - [Chapter 1 exercises](#), #14: UN Votes.

Exercise 10

IMS - [Chapter 1 exercises](#), #16: Shows on Netflix.

Wrap up

Submitting

! Important

Before you proceed, first, make sure that you have updated the document YAML with your name! Then, render your document one last time, for good measure.

To submit your assignment to Gradescope:

- Go to your Files pane and check the box next to the PDF output of your document (`lab-1.pdf`).
- Then, in the Files pane, go to More > Export. This will download the PDF file to your computer. Save it somewhere you can easily locate, e.g., your Downloads folder or your Desktop.
- Go to the course Canvas page and click on Gradescope and then click on the assignment. You'll be prompted to submit it.
- Mark the pages associated with each exercise. All of the papers of your lab should be associated with at least one question (i.e., should be "checked").

 Warning

If you fail to mark the pages associated with an exercise, that exercise won't be graded. This means, if you fail to mark the pages for all exercises, you will receive a 0 on the assignment. The TAs can't mark your pages for you, and for them to be able to grade, you must mark them.

Grading

Exercise	Points
Exercise 1	5
Exercise 2	4
Exercise 3	6
Exercise 4	5
Exercise 5	2
Exercise 6	6
Exercise 7	7
Exercise 8	5
Exercise 9	5
Exercise 10	5
Total	50
